

Esse Slip Repair Coupling

Patented Sealing System

SAB Blueseal compression fittings are made of polypropylene (PP) for joining polyethylene (PE) pipes, and are tested to withstand the working pressure of 16 bars (PN16).

Blueseal16 fittings obtained the most prestigious certificates from leading international bodies, and therefore, they are suitable for potable water pipelines.

The special feature that distinguishes the Blueseal16 fitting from others on the market is the patented sealing system, which consists of a unified lip gasket and a characteristic blue spacer ring, making it unique and singular. This sealing system is designed to push the gasket against the pipe wall thanks to the slide effect: when in the water piping system is put under pressure, this effect amplifies the seal. This occurs even in case of damaged pipes with some defects. Another special feature is a quick and easy installation, thanks to the shape of the gasket, designed to make the pipe insertion much easier.

Features

Patented sealing system

High water tightness reliability

Easy and quick installation

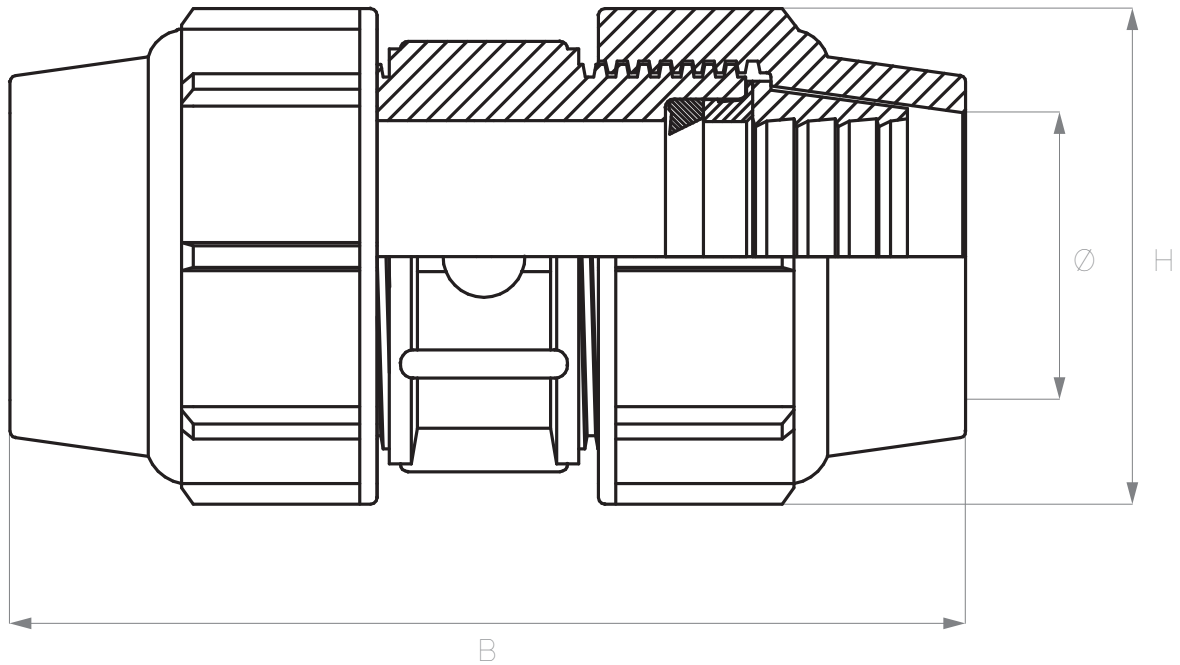

High shock absorption ability

Wide range of fittings
